> **Defining insight**
> First year students rarely fail registration through lack of effort. What runs out is **confidence**. When official channels do not give students proof that they are on the right path, they borrow that proof from seniors, guards and strangers. This report turns that insight into user stories, problem statements, testable hypotheses, points of view and journey maps.

Executive Summary

The Empathize stage showed that registration at IIITA usually *works*, but students often got through it on peer guidance and improvised workarounds. In this Define stage we pulled those 30 student accounts together into one clear statement of who we are designing for, what they need and why it matters. We used the d.school Point of View method (saturation, grouping, insights, directives) and the six "How Might We" lenses from the brief.

What we produced

Deliverable	Output in this report	Where
User stories	2 rounds (broad sweep, then granular): 7 epics, 26 single-goal stories with evidence codes and acceptance criteria, including 5 stakeholder stories	Section 3
How Might We questions	12 HMW questions, two for each of the six lenses, then prioritised by dot vote	Section 4
Problem statements	2 final problem statements, each refined from a weak draft and broken down into its parts	Section 5
Hypothesis statements	5 falsifiable hypotheses using the standard formula, ranked by risk, with test method and pass or fail metric	Section 6
Point of View	1 master POV, 4 persona POVs, mad-lib versions and POV-to-HMW translation	Section 7
Customer journey maps	4 persona journey maps with phases, actions, touchpoints, thoughts, emotional curve and opportunities	Section 8

Our two problem statements

> **PS-1 · Before travel**
>
> First year students travelling to IIITA from other states cannot confirm before they leave home that their documents, uploads and fee payment are complete and accepted, because requirements change late and the ERP portal does not show a clear accepted status.

> **PS-2 · On campus**
>
> First year students arriving on reporting day do not know which desk comes next, how long they will wait, or whether their hostel room will be usable, so they depend on WhatsApp groups and crowded queues, and their first night goes to cleaning and chasing repairs.

Report Contents

1. From Empathize to Define: our synthesis process 4
2. Who is the user? Composite characters and needs 7
3. User stories 10
4. How Might We questions across six lenses 13
5. Problem statements 16
6. Hypothesis statements 18
7. Point of View 21
8. Customer journey maps 25
9. Traceability and handoff to Ideation 35
10. Generative AI acknowledgement 36

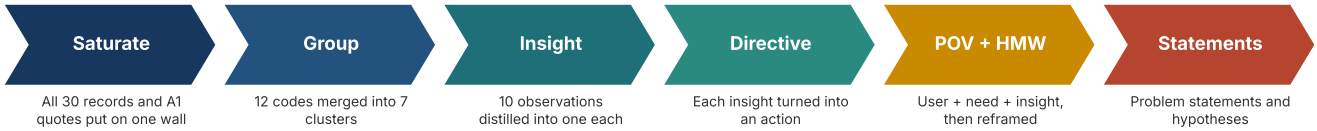

Presenting order

Pages for each speaker, in order.

Speaker	What they present	Pages	Count
1. Sudhanshu IIT2024081	Synthesis, empathy map, priorities, users	4 to 8	5
2. Kyan Mahajan IIT2024092	User stories	9 to 12	4
3. Akshat Parmar IIT2024077	How Might We, dot vote, problem statements	13 to 17	5
4. Sarthak Sharma IIT2024043	Hypotheses, risk order, master POV	18 to 22	5
5. Vishwas IIT2024087	Persona Ananya Verma: POV and journey	23 to 25	3
6. Vichanshu Raj IIT2024083	Persona Kabir Singh: POV and journey	26 to 28	3
7. Saumya Sood IIT2024018	Persona Rohan Iyer: POV and journey	29 to 31	3
8. Satwik Santosh IIT2024084	Persona Meera Nair: POV and journey	32 to 34	3

1. From Empathize to Define

The handout reminds us that the hardest leap is from “the concrete world of observations to a concisely stated point of view”. We worked in six steps. Each step mixed **flaring** tools (saturation, Powers of Ten, role play) with **focusing** tools (grouping, composite characters, insights, directives).

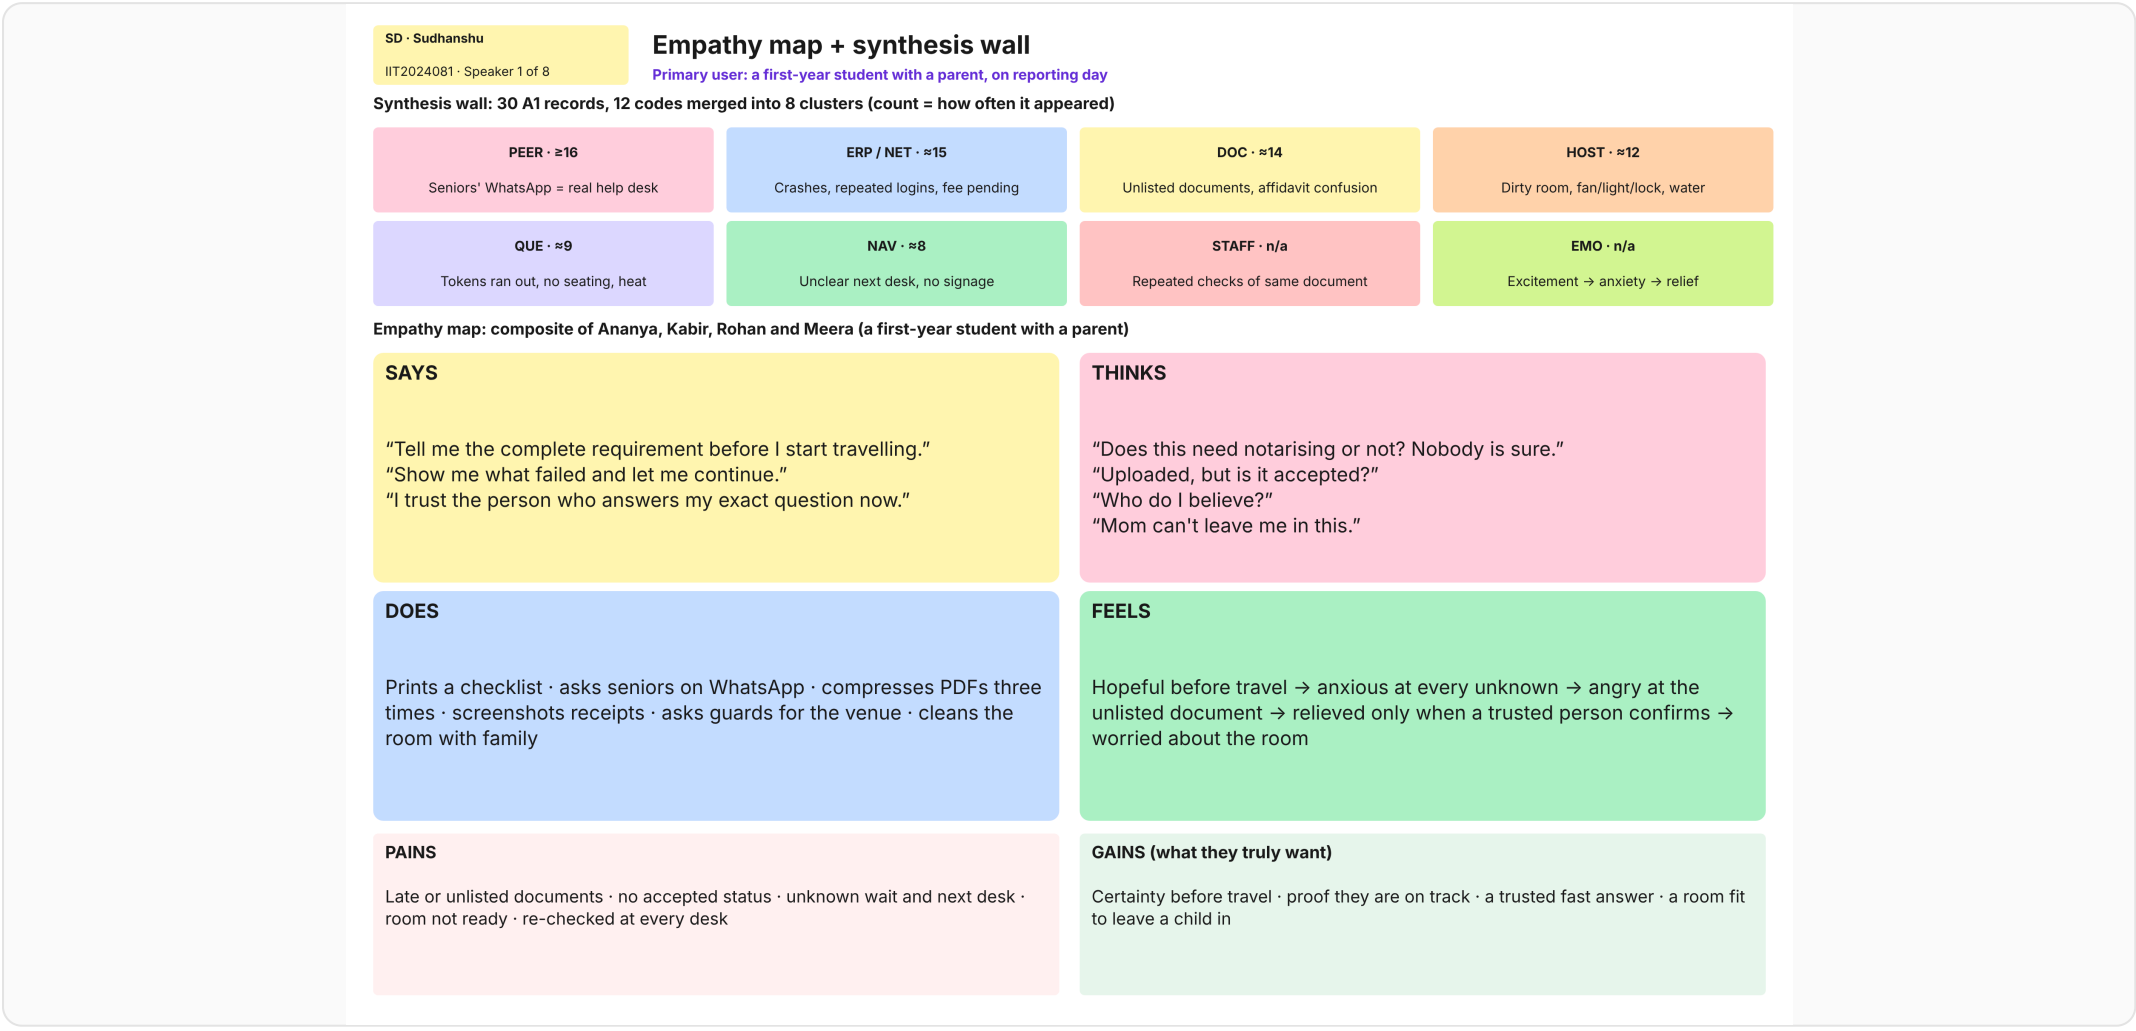

1.1 Insights from observations, then directives

Each row compresses several observations from the Empathize report (with coded frequency) into a single insight that is not obvious. We then wrote that insight as an action, which the handout calls “getting very close to a Point of View”.

What we observed (A1 evidence)	Insight (the non-obvious why)	Directive
Documents asked on campus that were not in the advisory; affidavit and notarisation confusion DOC ≈14	A late document hurts more than a long queue, because it collides with a **fixed return ticket and a parent’s leave**.	Freeze the checklist and prove it to the student before travel.
Crashes, repeated logins, unclear size limits, fee status pending ERP ≈15 NET	“Uploaded” does not feel like “done”. Students need a **saved proof state**, not just a submit button.	End every digital step in a visible, lasting confirmation.
Seniors’ WhatsApp groups used as the real help desk PEER ≥16	Newcomers trust **whoever answers their exact question now**, not whoever is official.	Give official information the speed and voice of a senior.
Tokens ran out, no seating, heat, no line, unclear next desk QUE ≈9 NAV ≈8	The chaos comes less from the wait itself and more from **not knowing how long, or where next**.	Make the route and the wait visible at every handoff.
Dirty rooms, broken fan, light or lock, painting still in progress, water concerns HOST ≈12 MESS	For families, registration ends when the **room is fit to leave their child in**, not when the roll number is issued.	Treat room readiness as part of finishing registration.
Documents uploaded online and then checked again at several desks DOC STAFF	Being checked again and again **feels like distrust** and wastes the effort put in at home.	Verify once and reuse the record.
Excitement turns to anxiety, then relief when a trusted person confirms EMO	Students need **repeated proof that they are on track**, not just a list of tasks.	Build a moment of reassurance into each stage.

Synthesis wall and empathy map

Primary user: a first-year student with a parent on reporting day

WHAT IT IS

The top half is the wall of 8 clusters with how often each appeared. The bottom half is the empathy map with what students say, think, do and feel, plus their pains and gains.

HOW TO READ IT

Bigger counts mean more of the 30 records mentioned it. In the empathy map, compare what students SAY (explicit asks) with what they FEEL (the real need).

WHAT IT TELLS US

Students ask for a better ERP but feel unsure whether they are on track. The real need is proof and reassurance.

1.2 Prioritising pain points: frequency × severity

We plotted each cluster by how often it appeared in the 30 records (directional) and how badly it affected students when it happened (blocking completion, extra travel cost, or loss of rest). The top-right quadrant became our design focus. Points high on severity but lower on frequency need safeguards, even though they are rarer.

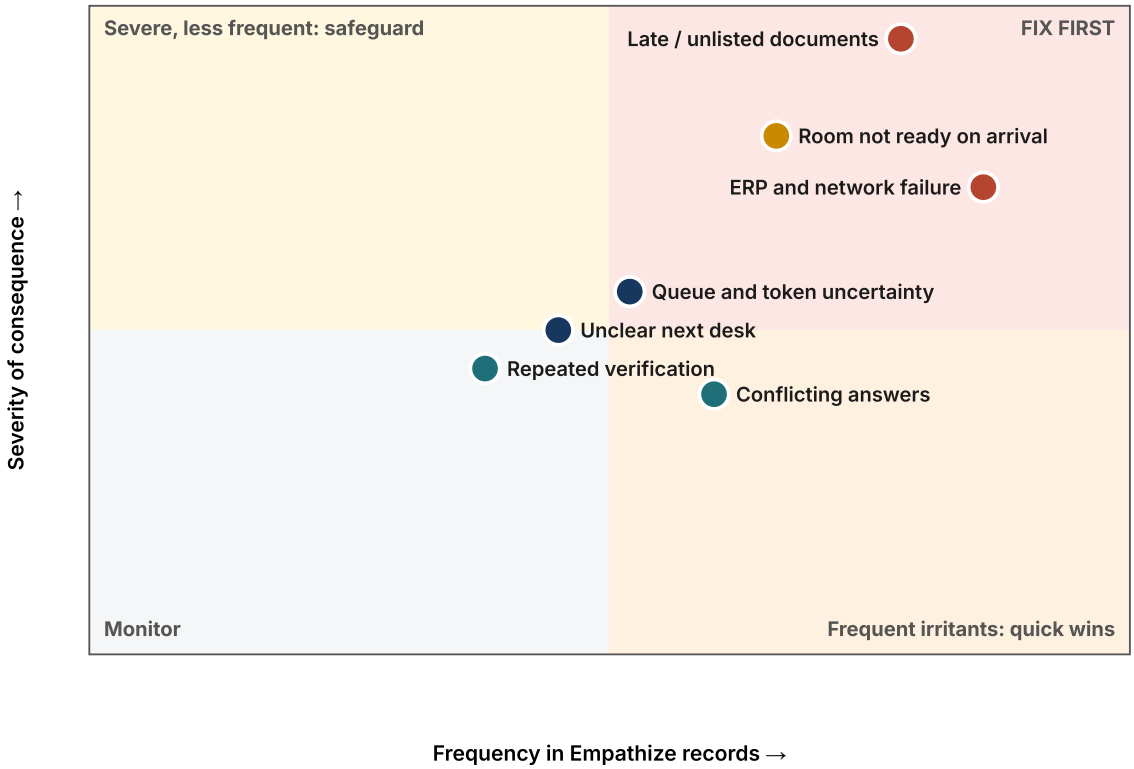

Figure 1. Pain point prioritisation matrix. Position is a team judgement based on the A1 coded counts and consequences.

Focus decision

Three clusters fall in “Fix first”: **late documents**, **ERP and status failure** and **room not ready**. They split naturally into the two halves of the journey, **before travel** and **on campus**. That split gives us our two problem statements. Queue and wayfinding issues are added to the on-campus statement because they make up the same reporting-day experience.

2. Who Is the User?

The Define brief says the first step is to find out **who the user is** and **what their needs are**. Our primary user is a **first year BTech student reporting to IIITA for physical registration, usually with a family member**. In practice the journey also involves several secondary stakeholders, and we wrote user stories for them as well (Section 3).

Role	Who	Why they matter to the definition
Primary user	First year BTech student (17 to 19 years old), often travelling from another state	Carries the documents, does the digital steps, lives in the room
Co-user	Parent or guardian travelling with the student	Shares the travel risk, waits through the queues, decides when it is safe to leave
Informal helper	Seniors and batchmates in WhatsApp groups; student volunteers	Currently the de facto help desk (≥16 of 30 records)
Service provider	Academic section, accounts, ERP team, hostel wardens, mess contractor	Own the rules, data and rooms behind every pain point (not interviewed yet; see A1 limitations)

2.2 What users need: functional, emotional and social

Need type	Need (written as a verb, not a feature)	Evidence	Persona
Functional	Know the exact, current document requirements before travelling	Unlisted affidavit or undertaking asked on campus	Ananya
Functional	Complete uploads and payment once, without losing progress	Crashes, repeated logins, pending fee status	Kabir
Functional	Find the next desk and expected wait without asking around	“There was no line and a lot of chaos”	Rohan
Functional	Rest in a clean, working room on the first night	Dirty room; fan, light and lock problems	Meera
Emotional	Feel sure they are on the right path at every handoff	Relief only after a trusted person confirms	All
Emotional	Feel that a technical failure is not their fault	Fear of being blamed for portal errors	Kabir
Social	Look prepared and capable in front of family	Parents travelling, fixed return plans	Ananya, Meera
Social	Belong to the student community from day one	Valued seniors who “personally guide us”	Rohan

> **Implicit vs explicit needs**
>
> Students *explicitly* asked for “a better ERP” or “more staff”. What they *implicitly* need is **certainty and reassurance**. The handout calls dealing with implicit needs rather than explicit problems a sign that a POV is getting good, so we use the implicit need as the backbone of every statement that follows.

User story map: the backbone of the reporting journey

7 epics, each with a lead persona, grouped by when they happen

KM · Kyan Mahajan

IIT2024092 · Speaker 2 of 8

User story map: backbone of the reporting journey

7 epics × 26 stories; every epic keeps its lead persona and one broad story

BEFORE TRAVEL			ON REPORTING DAY			AFTER ENROLMENT
E1 Prepare with confidence	**E2 Complete digital work before travel**	**E3 Recover from an exception**	**E4 Navigate the campus process**	**E5 Receive trusted human guidance**	**E6 Verify once**	**E7 Move into a ready room**
Lead: Ananya I want to know everything before travelling	**Lead: Kabir** I want to finish online steps from home	**Lead: Kabir** I want to understand what went wrong, recover fast	**Lead: Rohan** I want to move through without feeling lost	**Lead: Rohan** I want to a verified person, not rumour	**Lead: Ananya** I want to uploaded effort recognised	**Lead: Meera** I want to live in the room from night one

Quality rules we applied to every story (from the brief)

1 broad sweep first · 2 fill gaps top-down (persona × epic) · 3 add real insights (students' own words and devices) · 4 beware of AND · 5 goals, not solutions

Before (fails the AND test)

As Kabir, I want to upload my documents and pay my fees and see my status so that registration is done.

After (three stories, one goal each)

US-06 saved progress · US-09 payment confirmation · US-08 accepted status

WHAT IT IS

A story map lays the epics along the journey from home to hostel so the whole experience is visible on one page.

HOW TO READ IT

Dark boxes are the 7 epics. Yellow notes name the lead persona and the broad story. Coloured bars show when it happens: before travel, on reporting day, after enrolment.

WHAT IT TELLS US

Most epics sit before and during reporting day; only one is about the room, which is why PS-2 pairs the queue with the room.

3. User Stories

We followed the five rules in the brief: **start with a broad sweep**, **fill gaps top-down** (persona × epic), **add real insights** (the words and devices students mentioned), **beware of "AND"**, and **focus on goals, not solutions**.

3.1 Round 1: broad sweep (one story per epic)

Epic	Lead persona	Broad user story
E1 Prepare with confidence	Ananya	As a student preparing at home, I want to know everything I need before travelling so that the trip goes as planned.
E2 Complete digital work before travel	Kabir	As a student with my documents ready, I want to finish all online steps from home so that campus time is used only for physical steps.
E3 Recover from an exception	Kabir	As a student whose upload or payment failed, I want to understand what went wrong so that I can recover quickly.
E4 Navigate the campus process	Rohan	As a student arriving on campus, I want to move through registration without feeling lost so that the day feels manageable.
E5 Receive trusted human guidance	Rohan	As a newcomer facing unclear instructions, I want a person with verified information so that I act without relying on rumour.
E6 Verify once	Ananya	As a student who already uploaded documents, I want that effort recognised so that I am not checked repeatedly.
E7 Move into a ready room	Meera	As a newly enrolled student, I want a room I can live in from the first night so that my family leaves with confidence.

3.2 Quality checks we applied

The "AND" test: split it

Before As Kabir, I want to upload my documents and pay my fees and see my status so that registration is done.

After Three stories with one goal each: **US-06** (saved progress), **US-09** (payment confirmation), **US-08** (accepted status).

Goal, not solution: reframe it

Before As Ananya, I want a mobile app with a checklist so that I can prepare.

After **US-01**: As Ananya, I want to see one dated list of every required document so that I can leave home knowing nothing extra will be asked. (The app was removed: a checklist could be a PDF, an SMS, a WhatsApp bot or a DigiLocker pull.)

Real insights: using the students' own language

Phrases such as *"mentioned beforehand"*, *"crashed without warning"*, *"seniors personally guide us"* and *"no line and a lot of chaos"* were copied onto story cards so that the stories sound like our users. Devices noted in A1 (personal hotspot, phone-first WhatsApp use, ethernet on campus) shaped the stories and acceptance criteria for E2 and E5.

3.3 Round 2: granular user stories

Format: As [persona], I want to **[goal]** so that **[benefit]**. Evidence codes are from the A1 coding framework. Acceptance criteria give each story a testable meaning of "done". Stakeholder stories are **assumptions to validate**, because staff were not interviewed in A1.

ID	Persona	User story	Evidence	Acceptance criteria
US-01 E1	Ananya	As **Ananya**, I want to **see one dated list of every required document** so that **I can leave home knowing nothing extra will be asked on campus**.	DOC	List shows a version date; zero unlisted documents requested on the day
US-02 E1	Ananya	As **Ananya**, I want to **see an annotated sample of each document** so that **I do not have to guess what a valid affidavit looks like**.	DOC	Each item links to a sample showing format, stamp and signatory
US-03 E1	Ananya	As **Ananya**, I want to **be alerted the moment a requirement changes** so that **I can arrange it before I book travel**.	DOC, TIME	Change alert reaches the student within 24 h of the change
US-04 E1	Ananya	As **Ananya**, I want to **know which documents need notarisation** so that **I visit a notary only once**.	DOC	Each item is marked as self-attested, notarised or original
US-05 E1	Parent stakeholder	As **Parent**, I want to **know how long reporting day will take** so that **I can book our return journey confidently**.	TIME	Published time window per reporting slot
US-06 E2	Kabir	As **Kabir**, I want to **have my upload progress saved automatically** so that **a crash does not make me start over**.	ERP	Progress survives a logout or crash
US-07 E2	Kabir	As **Kabir**, I want to **see the file size and format limit before uploading** so that **my file is not rejected without explanation**.	ERP	Limit shown next to each upload button
US-08 E2	Kabir	As **Kabir**, I want to **see whether each document has been accepted** so that **I know when I am truly done**.	ERP	Each document shows Uploaded, Under review, Accepted or Action needed
US-09 E2	Kabir	As **Kabir**, I want to **see my fee payment confirmed within minutes** so that **I do not pay twice or panic**.	ERP	Status updates in under 15 min after payment
US-10 E2	Ananya	As **Ananya**, I want to **download a readiness receipt** so that **I can show proof of completion at the campus desk**.	ERP	Receipt carries a QR code and timestamp
US-11 E3	Kabir	As **Kabir**, I want to **be told the exact reason an upload was rejected** so that **I fix only that document**.	ERP	Rejection message names the cause and the fix
US-12 E3	Kabir	As **Kabir**, I want to **raise a help request with a screenshot attached** so that **I do not explain my problem to several people**.	ERP, STAFF	Ticket ID issued; one owner assigned
US-13 E4	Rohan	As **Rohan**, I want to **see my full route of desks when I arrive** so that **I always know my next step**.	NAV	Route shown on token or phone at entry

ID	Persona	User story	Evidence	Acceptance criteria
US-14 E4	**Rohan**	As **Rohan**, I want to **see the live wait time at my next desk** so that **I can plan breaks with my family**.	QUE	Estimate shown and accurate to within 10 min
US-15 E4	**Parent** stakeholder	As **Parent**, I want to **have a shaded place to sit near the desks** so that **waiting does not exhaust us**.	QUE	Seating provided for at least 1.5× the expected peak
US-16 E4	**Rohan**	As **Rohan**, I want to **get a reporting time slot before I travel** so that **I do not arrive to find tokens finished**.	QUE, TIME	Every admitted student holds a slot 7 days ahead
US-17 E5	**Rohan**	As **Rohan**, I want to **get a verified answer in chat within minutes** so that **I do not have to rely on rumours**.	PEER, STAFF	Median first reply under 10 min in reporting week
US-18 E5	**Rohan**	As **Rohan**, I want to **recognise official volunteers on campus** so that **I know whose answer to trust**.	STAFF	Volunteers easy to identify; same FAQ as the office
US-19 E5	**Senior volunteer** stakeholder	As **Senior volunteer**, I want to **access the latest official FAQ** so that **my answers never contradict the office**.	PEER	FAQ version visible; volunteers notified of changes
US-20 E6	**Ananya**	As **Ananya**, I want to **have documents I already uploaded marked as verified** so that **I am not checked again at every desk**.	DOC	Physical check limited to originals required by policy
US-21 E6	**Desk officer** stakeholder	As **Desk officer**, I want to **see which documents are already verified** so that **I only handle exceptions**.	STAFF	Desk view highlights only the pending items
US-22 E7	**Meera**	As **Meera**, I want to **receive a room that was cleaned before key handover** so that **I can rest after a long day**.	HOST	Room has a signed inspection card at handover
US-23 E7	**Meera**	As **Meera**, I want to **report a broken fixture from my room door** so that **it gets fixed without me searching for the warden**.	HOST	Report logged in under 1 min; status visible
US-24 E7	**Meera**	As **Meera**, I want to **know my room and room-mate details before arrival** so that **there are no occupancy surprises**.	HOST	Details shared 3 days before reporting
US-25 E7	**Meera**	As **Meera**, I want to **know where drinking water and meals are on day one** so that **my family can leave reassured**.	MESS	Day-one essentials card given at key handover
US-26 E7	**Hostel warden** stakeholder	As **Hostel warden**, I want to **see which rooms failed inspection** so that **repairs finish before students arrive**.	HOST	Failed-room list available 48 h before reporting

4. How Might We Questions

For each of the six lenses in the brief we went back to the A1 evidence, named the trigger (the good thing, bad thing or assumption we saw), and wrote two HMW questions. We kept the questions **broad enough to allow many solutions** but **narrow enough to know where to start**.

Lens	Trigger from Empathize evidence	How Might We...
Amplify the good	Seniors answer quickly in familiar language; several students found fee payment smooth.	**H01** HMW make official guidance feel as quick and friendly as a senior's WhatsApp reply?
		H02 HMW spread the clarity of the smooth fee-payment step to every other step?
Eliminate the bad	Unlisted documents, upload crashes and a second round of uploads on campus.	**H03** HMW make it impossible for a document outside the checklist to be requested on the day?
		H04 HMW remove the need to upload anything again once on campus?
Explore the opposite	Reporting day feels like an inspection the student has to survive.	**H05** HMW turn reporting day into a welcome the student looks forward to?
		H06 HMW let the institute prove readiness to the student, instead of the student proving everything to the institute?
Question the assumptions	"Originals must be checked at every desk." "Registration ends at the roll number." "Everyone arrives at once."	**H07** HMW treat a verified digital record as enough, so physical checks become exceptions?
		H08 HMW define "registration complete" as "settled in a ready room"?
Identify unexpected resources	DigiLocker (JoSAA-verified documents), seniors, waiting parents, campus screens, the ERP SMS gateway, housekeeping staff.	**H09** HMW use documents already verified in DigiLocker or JoSAA so students upload less?
		H10 HMW turn waiting parents and senior volunteers into part of the welcome and room check?
Create an analogy	Airline web check-in, hospital OPD token screens, hotel "room ready" status, food-delivery tracking.	**H11** HMW give students a boarding-pass style "ready to report" pass, like airline web check-in?
		H12 HMW show room readiness the way a hotel front desk knows a room is cleaned and inspected?

4.1 Converging: dot voting

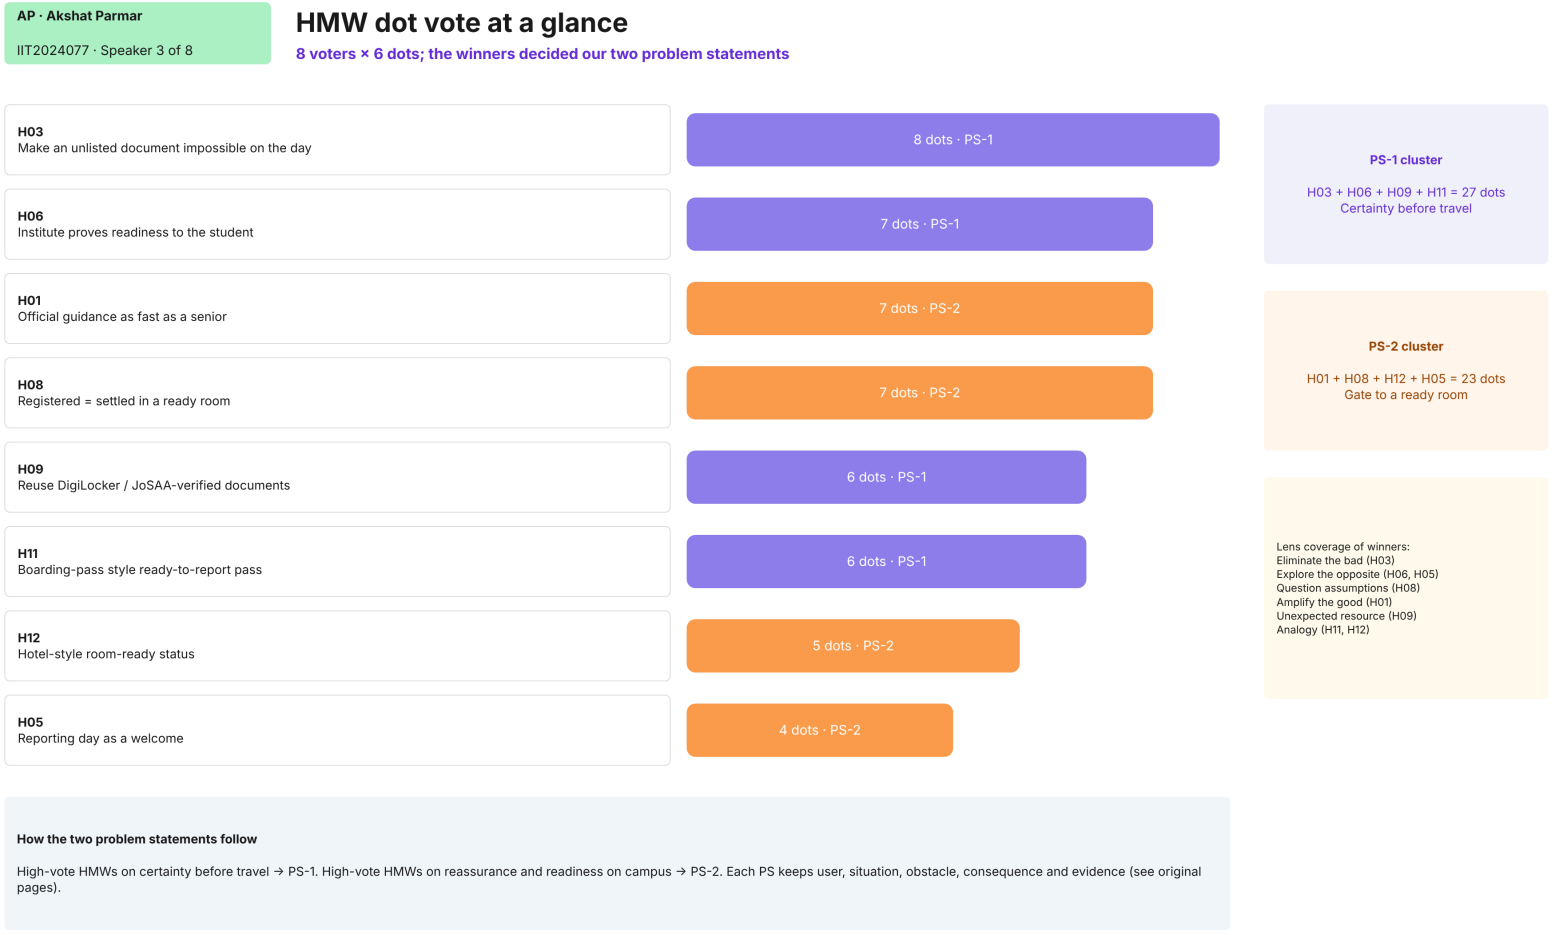

Each of the 8 team members had 6 dots to spend on the HMWs they found most promising. A dot meant the HMW is *grounded in evidence*, *open to many ideas* and *important to the student*. We then grouped the winners by the part of the journey they belong to.

HMW	Short form	Dots (of 8 voters)	Belongs to
H03	Make an unlisted document impossible on the day	●●●●●●●● 8	PS-1
H06	Institute proves readiness to the student	●●●●●●● 7	PS-1
H09	Reuse DigiLocker / JoSAA-verified documents	●●●●●● 6	PS-1
H01	Official guidance as fast as a senior	●●●●●●● 7	PS-2
H08	Registration complete = settled in a ready room	●●●●●●● 7	PS-2
H11	Boarding-pass style “ready to report” pass	●●●●●● 6	PS-1
H12	Hotel-style room-ready status	●●●●● 5	PS-2
H05	Reporting day as a welcome	●●●● 4	PS-2

> **What the vote told us**
>
> The highest-voted HMWs all aim at **certainty before travel** (H03, H06, H09, H11) or **reassurance and readiness on campus** (H01, H08, H12). This confirmed the split from Figure 1, and these two clusters became our two problem statements.

How Might We vote at a glance

8 voters × 6 dots; the winners decided the two problem statements

WHAT IT IS

A bar view of the dot vote from the table on the previous page, coloured by the problem statement each HMW belongs to.

HOW TO READ IT

Longer bar = more votes. Purple bars belong to PS-1, orange to PS-2. The boxes on the right show the totals.

WHAT IT TELLS US

PS-1 gathered 27 dots and PS-2 gathered 23, so both problems have strong support.

5. Problem Statements

We used the brief's examples of good and poor problem statements as a checklist. A good statement names a **specific user**, the **situation**, the **obstacle** and the **consequence**. It hints at where to start but **does not prescribe a solution**.

PS-1 · Certainty before travel

> **First year students travelling to IIITA from other states cannot confirm before they leave home that their documents, uploads and fee payment are complete and accepted, because requirements change late and the ERP portal does not show a clear accepted status. This turns a carefully planned trip into last-minute notarisation, repeated uploads and extra hotel nights, and makes a proud day feel anxious.**

Element	Our statement
User	First year BTech students (with family) travelling long distances to report
Situation	The final days before departure, when travel is already booked
Obstacle	Late or unlisted requirements; no durable "accepted" state for uploads and fee payment
Consequence	Emergency document arrangements, repeated work, extra hotel nights, anxiety for student and family
Evidence	DOC ≈14 ERP ≈15 TIME "One document was not mentioned in the advisory and it was asked here."

Draft 1 (rejected)

"Students find the registration process confusing. We need a better ERP system."

Why we rewrote it

Too vague ("confusing", "students"), no consequence, and it jumps straight to a solution ("better ERP"). The final version names the user, the moment of risk and the cost, and stays open to solutions that have nothing to do with the ERP, such as DigiLocker, SMS or a frozen advisory.

PS-2 · From gate to a ready room

> First year students arriving on reporting day **do not know which desk comes next, how long they will wait, or whether their hostel room will be usable**, so they depend on seniors' WhatsApp groups and crowded queues for answers. This leads to conflicting guidance, repeated verification and a first night spent cleaning or chasing repairs instead of settling in, while parents hesitate to leave.

Element	Our statement
User	First year students and accompanying family on reporting day
Situation	Moving from the registration hall to the hostel room in a single tiring day
Obstacle	Invisible route and wait; no single trusted source; room readiness not checked before handover
Consequence	Fatigue, conflicting answers, extra checks, unsettled first night, worried families
Evidence	QUE ≈9 NAV ≈8 PEER ≥16 HOST ≈12 "There was no line and a lot of chaos." "The room was quite dirty."

Draft 1 (rejected)

"Registration day is chaotic and hostel rooms are dirty. The institute should hire more staff and clean rooms."

Why we rewrote it

This lists symptoms, not a user need, and prescribes solutions ("hire more staff"). The final version keeps the student's point of view, links the hall and the hostel as one experience (as students live it) and explains why it matters.

5.1 How our statements meet the brief's criteria

Criterion (from good examples)	PS-1	PS-2
Specific user, not "people" or "customers"	✔ out-of-state first years with family	✔ first years and family on reporting day
Concrete situation and obstacle	✔ pre-departure; late requirements; no accepted status	✔ unknown next desk, wait and room state
Clear consequence (cost or emotion)	✔ notary rush, hotel nights, anxiety	✔ conflicting answers, unsettled night, worried parents
No solution prescribed	✔ no app or ERP named	✔ no staffing or tool named
Traceable to evidence	✔ DOC, ERP, TIME codes	✔ QUE, NAV, PEER, HOST codes

6. Hypothesis Statements

Our POV defines the *problem*. Each hypothesis sets up an *experiment* for one possible direction, using the brief's formula: **If we [solution] for [target user], then [expected change] because** [reason], **which we will know is true when** [measurable metric]. Every hypothesis has a stated failure condition, so it can be proven wrong.

H1 PS-1

If we **[publish a single, dated, version-controlled document checklist with annotated samples and change alerts]** for **[incoming first year students]**, then **[fewer students will arrive missing a document]** because **[they can confirm every item against an authoritative source before travel]**, which we will know is true when [day-of-registration document exceptions fall by at least 50% compared with the 2026 cycle, and at least 85% of pilot users list every required document correctly in a comprehension test].

Risky assumption: The admissions office can freeze requirements at least 10 days before reporting

Test method: Comprehension test with 15 to 20 current first years using a paper prototype; exception log next cycle

Falsified if: Below 70% comprehension, or exceptions fall by less than 25%

H2 PS-1

If we **[show a per-document status (Uploaded, Under review, Accepted, Action needed) and a downloadable readiness receipt]** for **[students completing ERP steps from home]**, then **[they will resolve digital issues before travelling]** because **[they can see exactly what is still pending instead of guessing]**, which we will know is true when [at least 80% of students reach "Ready" status 48 hours or more before reporting, and campus upload-desk visits drop by 60%].

Risky assumption: Verification staff can review uploads within 48 hours

Test method: Clickable Figma prototype tested with 10 students; staff time-and-motion estimate

Falsified if: Below 60% reach Ready early

H3 PS-2

If we **[give each arriving student a digital token that shows their full desk route and a live estimated wait]** for **[first years and families on reporting day]**, then **[they will feel less lost and ask fewer "where next?" questions]** because **[the sequence and the wait become visible instead of unknown]**, which we will know is true when [wayfinding questions at help points fall by 50%, and at least 70% of surveyed students rate the on-campus step 4 out of 5 or higher for clarity].

Risky assumption: Desk throughput is stable enough to estimate waits

Test method: Role-play simulation of the hall with 3 desks, printed route cards and a volunteer timer

Falsified if: Clarity rating below 3.5 out of 5

H4 PS-2

If we **[run an official help channel staffed by trained senior volunteers who work from one verified FAQ]** for **[newcomers who currently rely on unofficial WhatsApp groups]**, then **[they will choose the official channel for answers]** because **[it combines a senior's speed and tone with official accuracy]**, which we will know is true when [median first reply is under 10 minutes during reporting week, at least 60% of first years ask at least one question there, and reports of conflicting answers fall].

Risky assumption: Seniors will volunteer, and the office will keep the FAQ current

Test method: Wizard-of-Oz pilot: 4 volunteers answer questions from one batch section for a week

Falsified if: Median reply over 30 minutes, or under 30% adoption

H5 PS-2

If we **[require every room to pass a pre-handover inspection and put a scan-to-report defect code on each door]** for **[students moving into hostel rooms]**, then **[they will settle on the first night]** because **[defects are fixed before arrival or tracked quickly after it]**, which we will know is true when [at least 90% of rooms pass inspection at handover, and the median repair time for reported defects is under 24 hours].

Risky assumption: Maintenance can finish repairs in the 48 h before reporting

Test method: Inspect a sample of 20 rooms with the checklist; trial the QR form in one wing

Falsified if: Fewer than 75% of rooms pass, or median repair time over 72 h

6.1 Testing the riskiest assumptions first

Following the rule "test the risky assumptions first", we ranked the hypotheses by how uncertain the key assumption is and how much depends on it.

Order	Hypothesis	Uncertainty of assumption	Impact if wrong	Why this order
1	**H1** Frozen checklist	High	High	Everything in PS-1 assumes requirements *can* be fixed early; this needs an admissions conversation first
2	**H4** Official senior channel	High	Medium	Depends on volunteer motivation and office buy-in, which we have not observed
3	**H5** Room inspection gate	Medium	High	Maintenance capacity is unknown, but the cost of failure (first night) is high
4	**H2** Status and receipt	Medium	Medium	Technically feasible; risk is review turnaround time
5	**H3** Route token	Low	Medium	Easy to simulate cheaply with paper prototypes

Weak vs strong: our own iteration

Weak "If we make a registration app, students will be less stressed."

Strong H2 above names the user, the mechanism (visible status), the reason (no guessing) and a metric with a threshold (80% Ready 48 h early).

Hypothesis risk map and test plan

Test the riskiest assumption first

SR · Sarthak Sharma

IIT2024043 · Speaker 4 of 8

Hypothesis risk map + test plan

Test the riskiest assumption first (H1 → H4 → H5 → H2 → H3)

Uncertainty of assumption ↓ vs impact if wrong →

	Low impact	Medium impact	High impact
High uncertainty		H4 Senior channel — test order 2	H1 Frozen checklist — test order 1
Medium uncertainty		H2 Status + receipt — test order 4	H5 Room inspection — test order 3
Low uncertainty		H3 Route token — test order 5	

Master POV (compass for all five)

A first year student arriving at IIITA with family needs reassurance at every step that they are on the right path because, surprisingly, students rarely fail registration for lack of effort. What runs out is confidence, and when official channels give no proof, they borrow it from seniors, guards and strangers.

Pass / fail line for each hypothesis

H1 pass:
≥85% list every document · exceptions −50%
fail: <70% or <25% drop

Method: paper prototype, 15-20 first years

H4 pass:
median reply <10 min · ≥60% ask there
fail: >30 min or <30% adoption

Method: Wizard-of-Oz, 4 volunteers, 1 week

H5 pass:
≥90% rooms pass · repair <24 h
fail: <75% pass or >72 h

Method: inspect 20 rooms, QR in one wing

H2 pass:
≥80% Ready 48 h early · desk visits −60%
fail: <60% Ready early

Method: clickable Figma, 10 students

H3 pass:
questions −50% · ≥70% rate clarity ≥4
fail: clarity <3.5

Method: role-play, 3 desks, printed routes

WHAT IT IS

A grid placing each hypothesis by how uncertain its key assumption is and how bad it would be if wrong. The right side gives the pass and fail line for each.

HOW TO READ IT

Hotter colours (top right) are riskier. The numbers show the order we should test them in.

WHAT IT TELLS US

H1 (a frozen checklist) is both most uncertain and most important, so it needs an admissions conversation before any prototype.

7. Point of View

A POV is “the compass heading” for ideation: **User** + **Need** + **Insight**. We wrote one master POV for the whole project and one for each composite character. Each POV is also shown as the d.school “classified ad” mad lib and translated into an HMW for Assignment 3.

> **Master POV**
>
> **A first year student arriving at IIITA with family** needs **reassurance at every step that they are on the right path** because, surprisingly, **students rarely fail registration for lack of effort. What runs out is confidence, and when official channels give no proof, they borrow it from seniors, guards and strangers**.

Speaker 4 of 8 · Sarthak Sharma

7.2 Bad vs good: how we tested our POV

Version	Statement	Verdict
Solution-oriented	Students need a better ERP and more registration staff.	Names features, not needs; no insight; leaves no room for other solutions
Generic	Students need a smooth registration process because it is stressful.	“Students” is too broad and the insight is obvious; it would not inspire any surprising idea
Actionable	Master POV (above)	Specific user, need written as a verb, and a non-obvious insight (borrowed confidence) that opens up new directions

7.3 POV quality checklist (from the d.school handout)

The handout says a POV is getting good when…	Our evidence
You understand ordinary things in new ways	We now see a WhatsApp group as an unofficial *confidence service*, not as noise to ignore
You deal with implicit needs rather than explicit problems	Students asked for “a better ERP”; the implicit need is proof of being on track
Your team is speaking its own language	We now talk about “borrowed confidence”, “proof state” and “room-ready = registered”
Don’t try to design for everyone	One primary user (first year with family); stakeholders kept secondary
Don’t confuse solutions for needs	Every need is written as a verb; no app, portal or staff count named
Don’t try to include all your insights	Master POV uses one insight; the persona POVs each carry their own

Ananya Verma · The Prepared Planner

Composite character and Point of View. She or he combines several A1 responses; none is a single respondent.

WHO

18 · Patna, Bihar · ~600 km by train with her father · fixed return ticket two days later

Behaviour: Reads every advisory, keeps a printed folder, uploads early
Devices: Android phone; checks email and ERP every evening
Core need: Certainty before departure

"Tell me the complete requirement before I start travelling."

POINT OF VIEW: USER + NEED + INSIGHT

Ananya Verma, the The Prepared Planner, **needs to be certain before boarding the train that the document file is complete** because **a single late document does not just add a task; it collides with a fixed return ticket and a parent's leave from work.**

CLASSIFIED-AD MAD LIB

Prepared planner from Patna with a fixed return ticket seeks a final, trustworthy document list, so that one surprise affidavit does not break a carefully planned family trip.

QUESTION CARRIED INTO IDEATION (A3)

HMW make the checklist so trustworthy that families plan travel around it?

Ananya Verma: how the day feels, step by step

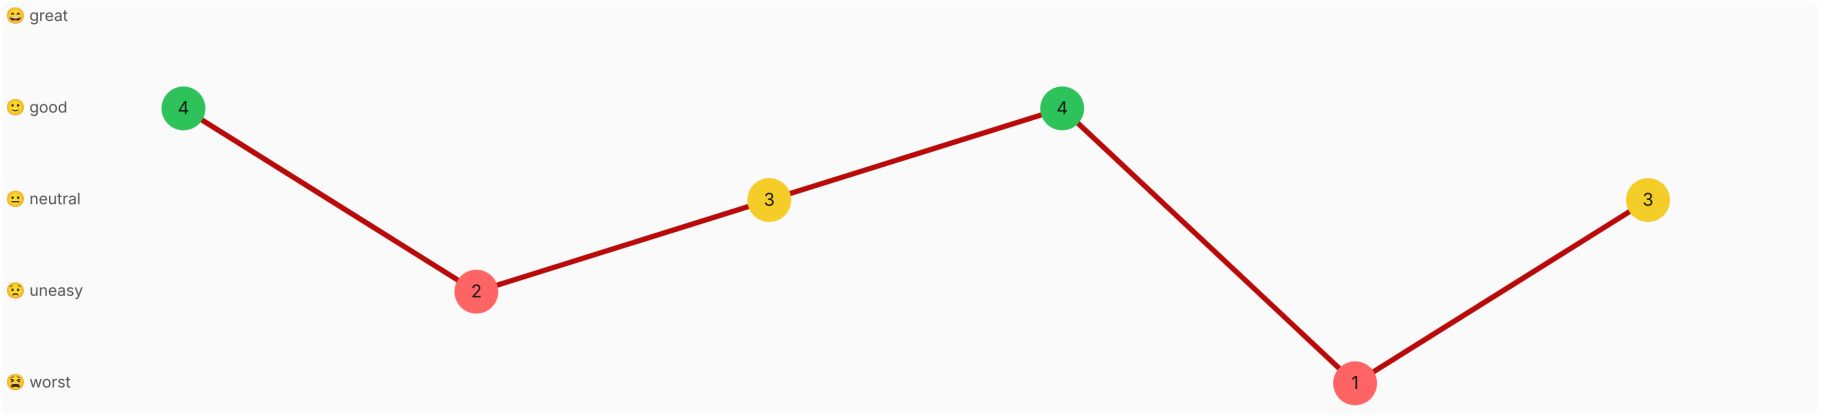

Built from the smiley row of the journey map that follows

VS · Vishwas

IIT2024087 · Speaker 5 of 8

Ananya Verma · The Prepared Planner

Emotion curve built from the journey map below

Lowest points

Valley: verification desk, unlisted undertaking

Highest points

Peak: arrival and reading the advisory

POV compass

HMW make the checklist so trustworthy that families plan travel around it?

Linked hypotheses: H1, H2 · PS-1

Scale: 5 = delighted, 1 = worst moment. Scores read directly off the smiley row of the original journey map (kept on the next page).

WHAT IT IS

An emotion curve plots how the person feels at each of the six steps of their day. Green dots are good moments, red dots are bad ones.

HOW TO READ IT

Read left to right. The higher the dot, the happier. The box under each dot names the step. The three boxes at the bottom name the lowest and highest points and the question for ideation.

WHAT IT TELLS US

The lows are where design must help first, and they line up with the hypotheses we test.

8. Customer Journey Map · Ananya Verma: The Prepared Planner

ACTOR
Ananya Verma, 18, Patna. Travels with her father; return train already booked.

SCENARIO
Preparing for and completing physical registration within a fixed two-day trip.

GOAL
Finish everything on day one so her father can catch the return train.

EXPECTATIONS
A complete advisory, no surprises, a predictable day.

	1. Read advisory	2. Arrange documents	3. Upload and pay	4. Travel and arrive	5. Verification desk	6. Enrolled; father leaves
Doing	• Downloads the advisory PDF • Makes a printed checklist • Books the train	• Gets the affidavit drafted • Visits a notary • Asks seniors whether self-attestation is enough	• Uploads scans to ERP • Pays fee online • Screenshots the receipt	• Overnight train • Reaches campus early • Joins the crowd at the venue	• Shows original documents • Is asked for an undertaking not listed in the advisory • Rushes to get it made	• Gets roll number late in the day • Father changes his ticket • Settles into hostel
Touchpoints	Institute website, email, advisory PDF	Notary, WhatsApp group, parents	ERP portal, bank app	Train, auto, campus gate, guards	Verification desk, staff, nearby notary	Academic section, railway app, hostel
Thinking	*"Looks complete. I'll prepare everything this week."*	*"Does this need notarising or not? Nobody is sure."*	*"Uploaded, but is it accepted?"*	*"We made it! Let's finish fast."*	*"This was never mentioned! What about the train?"*	*"Done, but it cost us an extra night."*
Feeling	🙂	😟	😐	🙂	😫	😐
Pain points	Advisory has no version date and no samples	Notarisation rules unclear; conflicting advice	No accepted status; fee status shows pending	No reporting slot; crowd already formed	Unlisted document requested; travel plan at risk	Extra hotel night and ticket change
Opportunities	Dated, versioned checklist with samples (H1)	Mark each item: self-attested, notarised or original	Per-document status and readiness receipt (H2)	Pre-assigned reporting slots	No document outside the checklist on the day (H03)	Publish the expected reporting-day duration

Kabir Singh · The Digitally Blocked Registrant

Composite character and Point of View. She or he combines several A1 responses; none is a single respondent.

WHO

18 · small town near Kota · every document ready · home connection is a mobile hotspot

Behaviour: Retries, logs in again, compresses files, asks batchmates for fixes
Devices: Budget laptop and phone hotspot; screenshots everything
Core need: Visible, recoverable progress

"Show me what failed and let me continue from that point."

POINT OF VIEW: USER + NEED + INSIGHT

Kabir Singh, the The Digitally Blocked Registrant, **needs to see exactly where a digital step stopped, and continue from there** because **the frustration is not the error itself but not knowing whether progress, payment or blame has been lost.**

CLASSIFIED-AD MAD LIB

Hotspot-dependent student with every document ready seeks a portal that remembers progress and explains failure, so that a crash costs one minute, not one evening and a second payment.

QUESTION CARRIED INTO IDEATION (A3)

HMW make every failure recoverable from exactly where it happened?

Kabir Singh: how the day feels, step by step

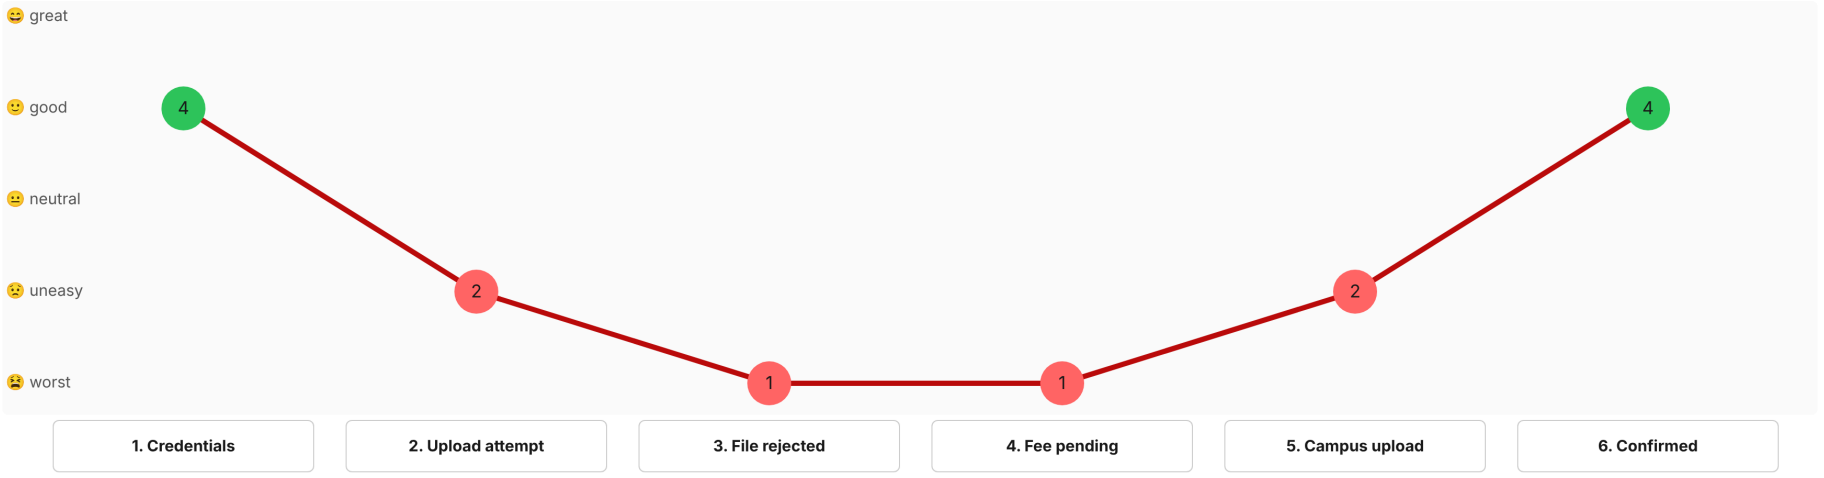

Built from the smiley row of the journey map that follows

VR · Vichanshu Raj

IIT2024083 · Speaker 6 of 8

Kabir Singh · The Digitally Blocked Registrant

Emotion curve built from the journey map below

Lowest points

Valley: file rejected, fee pending (payment taken, status unpaid)

Highest points

Peak: confirmation, but via a senior

POV compass

HMW make every failure recoverable from exactly where it happened?

Linked hypotheses: H2 · PS-1

Scale: 5 = delighted, 1 = worst moment. Scores read directly off the smiley row of the original journey map (kept on the next page).

WHAT IT IS

An emotion curve plots how the person feels at each of the six steps of their day. Green dots are good moments, red dots are bad ones.

HOW TO READ IT

Read left to right. The higher the dot, the happier. The box under each dot names the step. The three boxes at the bottom name the lowest and highest points and the question for ideation.

WHAT IT TELLS US

The lows are where design must help first, and they line up with the hypotheses we test.

8. Customer Journey Map · Kabir Singh: The Digitally Blocked Registrant

ACTOR
Kabir Singh, 18, near Kota. All documents ready; home internet is a phone hotspot.

SCENARIO
Completing ERP upload and fee payment from home, then finishing on campus.

GOAL
Finish every digital step before travel, without losing progress or paying twice.

EXPECTATIONS
A portal that works, clear limits, instant confirmation.

	1. Get credentials	2. Upload attempt	3. File rejected	4. Fee pending	5. Campus upload desk	6. Confirmed
Doing	• Receives ERP login by email • Logs in successfully • Reads the upload instructions	• Uploads the first file • Portal crashes • Logs in again and repeats	• Upload fails without a reason • Compresses PDF three times • Asks batchmates	• Pays fee • Status still shows pending hours later • Considers paying again	• Is told to re-upload on campus • Campus network weak • Uses a friend's hotspot	• A senior shows a workaround • Status finally reads accepted • Gets roll number
Touchpoints	Email, ERP portal	ERP portal, hotspot	ERP portal, online compressor, WhatsApp	Payment gateway, ERP, bank SMS	Upload desk, campus Wi-Fi, peers	Senior, desk officer
Thinking	*"Finally, let's get this done tonight."*	*"Did it save anything? Starting again..."*	*"What is wrong with my file?!"*	*"Money's gone, but the portal says unpaid."*	*"I already did this at home."*	*"Sorted, thanks to a senior, not the system."*
Feeling	🙂	😟	😫	😫	😟	🙂
Pain points	Instructions do not state size or format limits	No autosave; repeated logins at peak traffic	Error message gives no cause	Delayed payment reconciliation	Second upload round; unreliable network	Success depended on informal help
Opportunities	Show limits beside each upload button	Autosave and resume where it failed	Rejection reason plus the fix (US-11)	Confirmation in under 15 min (US-09)	Readiness receipt so nothing is redone on campus (H2)	Help ticket with one owner (US-12)

Rohan Iyer · The Guided Newcomer

Composite character and Point of View. She or he combines several A1 responses; none is a single respondent.

WHO

17 · first in the family to join an IIIT · arrives with his mother · first visit to Prayagraj

Behaviour: Follows the seniors' WhatsApp group closely, asks guards and volunteers
Devices: Phone always on WhatsApp; rarely opens official PDFs
Core need: A trusted answer, fast

"I trust the person who answers my exact question now."

POINT OF VIEW: USER + NEED + INSIGHT

Rohan Iyer, the The Guided Newcomer, **needs a trusted voice that answers the exact question right now** because **newcomers judge an answer by how responsive it is, not by how official its source is, which is why the seniors' group wins.**

CLASSIFIED-AD MAD LIB

First-generation newcomer on a first visit to campus seeks a fast, reliable answer to "what next?", so that rumours never have to fill the silence.

QUESTION CARRIED INTO IDEATION (A3)

HMW give official answers the speed and warmth of a senior?

Rohan Iyer: how the day feels, step by step

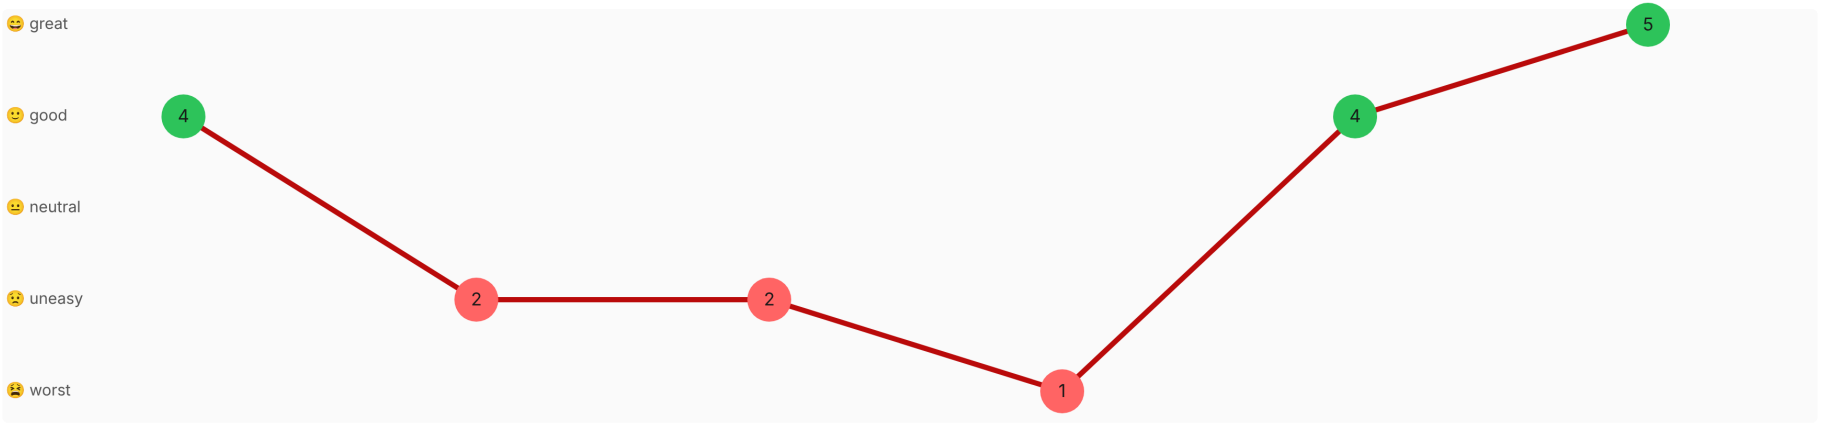

Built from the smiley row of the journey map that follows

SS · Saumya Sood

IIT2024018 · Speaker 7 of 8

Rohan Iyer · The Guided Newcomer

Emotion curve built from the journey map below

Lowest points

Valley: tokens run out, no seating, unknown wait

Highest points

Peak: roll number and photo with mother

POV compass

HMW give official answers the speed and warmth of a senior?

Linked hypotheses: H3, H4 · PS-2

Scale: 5 = delighted, 1 = worst moment. Scores read directly off the smiley row of the original journey map (kept on the next page).

WHAT IT IS

An emotion curve plots how the person feels at each of the six steps of their day. Green dots are good moments, red dots are bad ones.

HOW TO READ IT

Read left to right. The higher the dot, the happier. The box under each dot names the step. The three boxes at the bottom name the lowest and highest points and the question for ideation.

WHAT IT TELLS US

The lows are where design must help first, and they line up with the hypotheses we test.

8. Customer Journey Map · Rohan Iyer: The Guided Newcomer

ACTOR
Rohan Iyer, 17. First in family at an IIIT; first visit to Prayagraj with his mother.

SCENARIO
Moving through reporting day from the campus gate to receiving a roll number.

GOAL
Know what to do at every moment without feeling lost or making a mistake.

EXPECTATIONS
Clear signs, a sensible order, someone to ask.

	1. Join seniors' group	2. Conflicting info	3. Arrive at venue	4. Token and queue	5. Volunteer guides	6. Roll number
Doing	• Added to batch WhatsApp group • Reads senior tips • Saves screenshots	• Official mail says one thing • Group says another • Asks three people	• Finds venue by asking guards • No signage at entry • Waits in the sun	• Gets a token • Tokens run out for later arrivals • No seating for his mother	• A senior volunteer walks him through the desks • Explains each step • Shares the hostel location	• Receives roll number • Photo with his mother • Heads to hostel
Touchpoints	WhatsApp, seniors	Email, WhatsApp, helpline	Gate, guards, venue	Token desk, waiting hall	Senior volunteer, desks	Academic section
Thinking	*"Seniors seem helpful, and they reply quickly!"*	*"Who do I believe?"*	*"Where do I even start?"*	*"How long will this take? Mom is tired."*	*"Okay, now I get it."*	*"I'm officially an IIITian!"*
Feeling	🙂	😟	😟	😫	🙂	😄
Pain points	Unofficial info may be out of date	No single source of truth	No visible route or start point	Unknown wait; heat; limited seating	Help depends on finding the right person	Relief came late in a long day
Opportunities	Official channel with senior volunteers (H4)	One verified FAQ shared by staff and volunteers (US-19)	Route card or token at entry (H3)	Live wait time, seating, reporting slots (US-14, US-16)	Identifiable trained volunteers (US-18)	Celebrate this moment as a welcome (H05)

Meera Nair · The Transitioning Resident

Composite character and Point of View. She or he combines several A1 responses; none is a single respondent.

WHO

18 · Kochi · first time living away from home · parents fly back the next morning

Behaviour: Inspects the room, cleans, buys a cooler, looks for the warden
Devices: Video-calls family; shares room photos with them
Core need: A room ready to live in

"Registration is not finished until I can actually settle into the room."

POINT OF VIEW: USER + NEED + INSIGHT

Meera Nair, the The Transitioning Resident, **needs to feel at home on the very first night** because **for students and families, registration is not finished at the roll number; it ends when the room is good enough for the family to leave.**

CLASSIFIED-AD MAD LIB

First-time hosteller whose parents fly home tomorrow seeks a clean, working room at handover, so that the goodbye feels like a beginning, not a worry.

QUESTION CARRIED INTO IDEATION (A3)

HMW make "room ready" part of what "registered" means?

Meera Nair: how the day feels, step by step

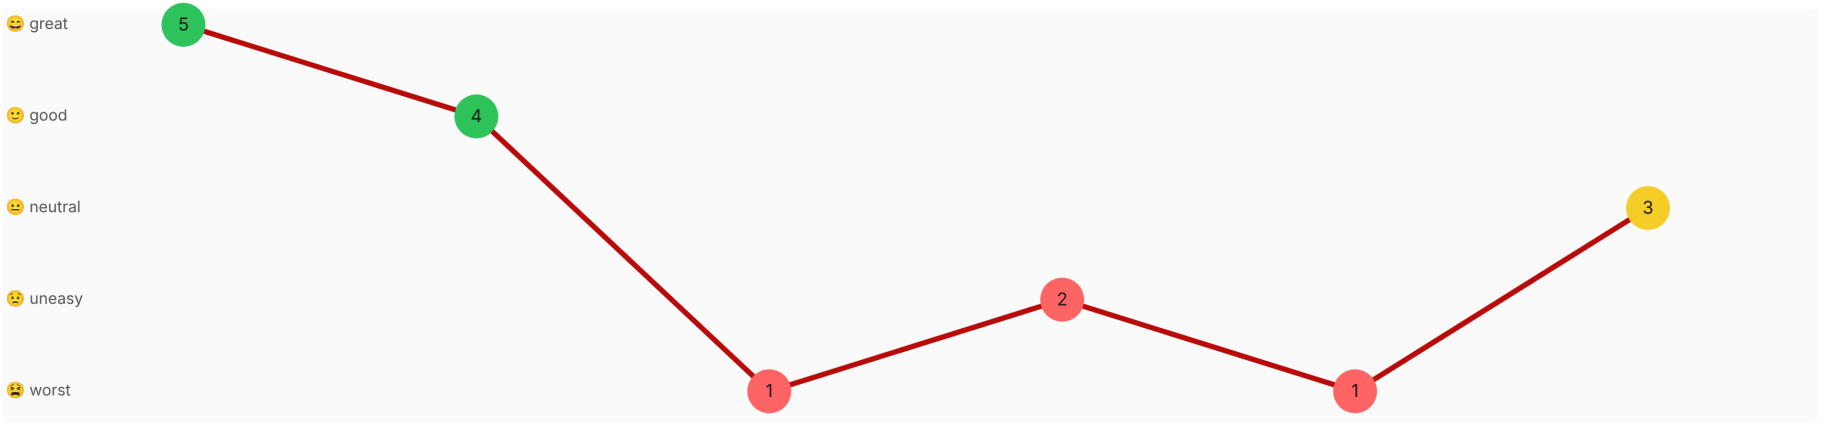

Built from the smiley row of the journey map that follows

ST · Satwik Santosh

IIT2024084 · Speaker 8 of 8

Meera Nair · The Transitioning Resident

Emotion curve built from the journey map below

Lowest points

Valleys: dusty room on entry, defect with no tracked repair

Highest points

Peak: enrolment is complete

POV compass

HMW make 'room ready' part of what 'registered' means?

Linked hypotheses: H5 · PS-2

Scale: 5 = delighted, 1 = worst moment. Scores read directly off the smiley row of the original journey map (kept on the next page).

WHAT IT IS

An emotion curve plots how the person feels at each of the six steps of their day. Green dots are good moments, red dots are bad ones.

HOW TO READ IT

Read left to right. The higher the dot, the happier. The box under each dot names the step. The three boxes at the bottom name the lowest and highest points and the question for ideation.

WHAT IT TELLS US

The lows are where design must help first, and they line up with the hypotheses we test.

8. Customer Journey Map · Meera Nair: The Transitioning Resident

ACTOR
Meera Nair, 18, Kochi. First time living away from home; parents fly back tomorrow.

SCENARIO
Moving from completed enrollment into a hostel room and the mess on day one.

GOAL
Have a clean, safe, working room so her parents leave reassured.

EXPECTATIONS
Room ready, basics working, someone to call if not.

	1. Enrolled	2. Room and key	3. Enter room	4. Fix it ourselves	5. Report defect	6. First night
Doing	• Completes enrollment • Calls family members back home • Walks to hostel office	• Gets room allotted • Collects key • Finds the block	• Opens the door to dust and paint smell • Fan light flickers • Door lock is loose	• Family cleans the room • Buys bucket, cooler, bedding • Asks about drinking water	• Searches for the warden • Told 'maintenance will come' • No time given	• Eats first mess meal • Parents leave next morning • Meets wing-mates
Touchpoints	Academic section, phone	Hostel office, warden	Room, fixtures	Local shops, neighbours	Warden, caretaker	Mess, wing-mates
Thinking	*"Registration done! The hard part is over."*	*"Can't wait to see my room."*	*"Mom can't leave me in this."*	*"We spent our last evening cleaning."*	*"When will someone actually fix the lock?"*	*"Getting better, but I still worry about the lock."*
Feeling	😄	🙂	😫	😟	😫	😐
Pain points	Assumes the room will be ready	Room-mate details unknown until now	Room not cleaned or inspected before handover	Setup work shifted to the family	No tracked repair request; safety worry	Unresolved defect lingers
Opportunities	Treat room readiness as part of registration (H08)	Share room details before arrival (US-24)	Pre-handover inspection gate (H5)	Day-one essentials card (US-25)	Scan-to-report code on the door (US-23)	Repair status visible to student and family

8.1 What the four journey maps reveal together

Pattern across maps	Where it appears	Implication for ideation
Two emotional valleys: one at the verification desk, one at room entry	Ananya phase 5, Meera phase 3	Registration needs two “moments of truth” designed: before travel and at the room door
Relief always comes from a person, never from a system	Kabir phase 6, Rohan phase 5	Make systems give the same reassurance a senior gives
Uncertainty hurts more than effort: “Is it accepted?”, “How long?”, “When will it be fixed?”	All four maps	Every step needs a visible status, a time estimate or a named owner
Work is pushed onto families: notary rush, waiting in heat, cleaning	Ananya, Rohan, Meera	Measure success by the family’s experience as well as the student’s
Peaks are celebratory moments (roll number, arrival)	Rohan phase 6, Meera phase 1	Amplify the good: turn these peaks into a designed welcome

9. Traceability and Handoff to Ideation

The table traces each problem statement back to its evidence and forward to the artefacts that test it, so the next stage starts from prioritised HMW questions and not from a fixed solution.

Thread	A1 evidence	User stories	Hypotheses	POV	HMW carried into Assignment 3
PS-1 Certainty before travel	DOC, ERP, NET, TIME	US-01 to US-12, US-20	H1, H2	Ananya, Kabir	HMW help students prove, before they leave home, that their registration is complete and accepted?
PS-2 Gate to a ready room	QUE, NAV, PEER, STAFF, HOST, MESS	US-13 to US-19, US-21 to US-26	H3, H4, H5	Rohan, Meera	HMW guide every student from campus gate to a ready room with confidence at each step?

Next steps

1. Validate the stakeholder assumptions behind H1 and H5 with the admissions office and a hostel warden (Section 6.1 order).
2. Run individual mind maps, a group brainstorm and SCAMPER on PS-1, PS-2 and the course problem statement (Assignment 3).
3. Build low-fidelity prototypes for the top ideas and test them against the hypothesis metrics.

Generative AI acknowledgement

Claude (Anthropic) was used as an assistant, October 2026. The thinking and design work is ours.

WHERE AI ASSISTED

- Rewording a few sentences so they read clearly
- Checking a story or hypothesis against the brief's rules (AND test, falsifiable)
- Alternative phrasings of some HMW questions
- Help laying out tables and the journey-map pages

WHAT WAS OUR OWN WORK

- All research evidence (our own 30 Empathize records)
- Every insight, persona, problem statement, hypothesis, idea, rating and decision
- The mind maps, brainstorm sessions and SCAMPER work, done by the named members
- Final wording and checking of every page

Purpose	Prompts we used (examples)
Wording	Rewrite this user story so it has one persona and one goal. Keep my meaning.
Rule check	Does this hypothesis have a way to fail? What number would show it is wrong?
HMW wording	Give two other ways to phrase this HMW that stay open to many solutions.
Consistency	Check that H1 to H5 and US-01 to US-26 are used the same way across the report.
Layout	Help me fit this journey-map table on one landscape page.

How AI was used, member by member

Tool: Claude (Anthropic), October 2026. The evidence is our own Empathize research (30 student records). The team declaration follows.

Member	Section	Where AI helped	What we did ourselves
Sudhanshu IIT2024081	Synthesis, empathy map, priorities	Suggested wording for a few insight and directive lines.	Grouped the 30 records, filled the empathy map from the quotes, placed the priority matrix.
Kyan Mahajan IIT2024092	User stories	Checked a few stories against the AND test.	Wrote the stories and acceptance criteria from the A1 evidence.
Akshat Parmar IIT2024077	HMW, dot vote, problem statements	Gave alternate phrasing for some HMWs.	Ran the dot vote, chose the winners, wrote both problem statements.
Sarthak Sharma IIT2024043	Hypotheses, master POV	Checked that each hypothesis could be proven false.	Set the metrics, risk order and the master POV.
Vishwas IIT2024087	Ananya: persona, POV, journey	Tidied the wording of the Ananya POV.	Mapped Ananya's six steps and scored her emotion curve.
Vichanshu Raj IIT2024083	Kabir: persona, POV, journey	Helped with the wording of the Kabir POV.	Mapped Kabir's upload and payment steps and scored his curve.
Saumya Sood IIT2024018	Rohan: persona, POV, journey	Helped with the wording of the Rohan POV.	Mapped Rohan's reporting day and scored his curve.
Satwik Santosh IIT2024084	Meera: persona, POV, journey	Helped with the wording of the Meera POV.	Mapped Meera's room and first-night steps and scored her curve.
